## **ABSTRACT**

Using a joint video and still image pipeline technology, a network may be
deployed through the Internet so that a user may acquire a remote high resolution
photograph using a low resolution video streamed from a remote camera as a view-finder.
The remote camera may enable the user to exercise control from a remote device through
the network or other communication channels. A network server may store the video and
the high resolution photograph, and either sends the video and the high resolution
photograph to the user upon payment or posts the video and the high resolution
photograph on a web page.
